### Extremely Attentive

"Recently I went to Arundel Physical Therapy & Fitness for an aggravating and very painful rotator cuff problem. I found the center and staff to be top-notch. The facility is brand new with the latest equipment. I have been to other physical therapy offices in the past but they couldn't compare to this great experience. My physical therapist, Bud Ward, was both friendly and knowledgeable. He was extremely attentive and kept me informed of the treatment process, as well as, my progress at every appointment. I would highly recommend Arundel Physical Therapy & Fitness to all my family and friends."

- Ray J.

### Blood Pressure Control 101

High blood pressure, also known as hypertension is a serious health problem, especially during the holidays when exercise seems to take a back seat and calorie-rich foods are in abundance. Most of us have heard about the importance of controlling high blood pressure, but did you know that **exercise** plays a key role?

*That's right!* Being physically active not only helps control your blood pressure, it also helps control body weight and strengthen the heart and lungs. A healthy weight, a strong heart and general well-being are all good for your blood pressure.

The type of exercise, specifically the intensity (how hard you exercise) and frequency (how often you exercise) plays an important role.

**Here's the good news.** You don't have to do too much. Being moderately active, like walking briskly, is beneficial when done regularly for a total of 30 minutes or longer at least 5 days a week.

#### What is moderate intensity for physical activity?

Here's a simple way to tell if your exercise intensity is on target:

- If you can easily carry on a full conversation and perform the activity at the same time, you are probably not working hard enough.
- If you can sing while exercising, your intensity is probably too easy.
- If you can carry on a conversation, but not a lengthy one, your intensity is probably right on target.
- If you get out of breath too quickly while exercising, or feel strained and have to stop to catch your breath, you are working too hard.

### How Often, How Hard and How Long??

For overall health benefits for your heart and lungs, be sure to participate in moderate aerobic exercise on a regular basis. Here are some guidelines to exercise in a safe and effective range:

- Get a total of at least **150 minutes** of moderate intensity aerobic exercise each week (that's 2 hrs and 30 minutes in a week.)
- Your weekly physical activity time can include **30 minutes/day** for **at least 5 days/week**.
- Don't forget to include *stretching* exercises daily.
- Also include *strengthening* exercises **at least 2 times/week**.

### The Untold Truth About Blood Pressure

When trying to combat high blood pressure, make sure to follow these 7 strategies.

1. **Are you overweight?** Maintaining a healthy weight will help prevent high blood pressure. Talk to your physician about this. This can be challenging, but here's what can make it attainable:
  - Limit the portion size of your meals and snacks, and cut way back on high calorie foods. If you eat as many calories as you burn each day, you'll maintain your weight. Eating fewer calories than you burn will facilitate weight loss. More importantly, weight loss (if you are overweight to begin

- with) will help control blood pressure.
2. **When you plan meals, think of your heart.** Choose a diet that includes plenty of fruits and vegetables. Avoid foods high in saturated fats and cholesterol.
  3. **Consume less salt.** Salt, or sodium, can increase blood pressure. For specific guidelines, consult your physician or nutritionist. As a general rule, limit your sodium intake to no more than 2,400 mg, or about 1 teaspoon of salt each day.
  4. **If you drink alcohol, practice moderation.** the recommended limit for men is no more than 2 drinks per day, and women is one alcoholic beverage per day.
  5. **Increase your physical activity.** Exercise is key! If you get very little exercise now, start slowly and work your way up to at least 30 minutes of a moderate-level activity, such as brisk walking or bicycling, each day.
  6. **Stop smoking.** Research shows that smoking increases your chances of developing a heart disease, stroke, peripheral arterial disease, and several forms of cancer.
  7. **Talk to your doctor.** Know what your blood pressure reading is and what it means to your health. Remember to take any medications consistently, as prescribed by your doctor.

If your daily routine includes hours of sitting at a desk and using countless labor-saving devices, it's possible to inadvertently slip into a pattern of inactivity. **Make the right decision and schedule an evaluation with us, so we can identify the do's and dont's of exercise and injury prevention while structuring the most appropriate exercise protocol for you.**

**Taking charge of your health is the best decision you can make this holiday season. The choice is yours.**
